

CARE CENTRAL CLOUD SERVICES

Care Central is an intelligent, web-enabled software that provides access to our HIPAA-compliant cloud* services and cyber secure Virtual Exam Room (VER) where clinicians examine, assess, and diagnose remote patients and recommend potential treatment options. Care Central software includes clinician and administrator portals, Virtual Exam Room (VER) capabilities, critical care modules and EMR gateways. This comprehensive, easy-to-use software allows users to manage patients, clinician profiles, and devices. Using Care Central's data analytics, a clinician or administrator can analyze trends, use actionable data, and make clinical decisions.

CLINICALLY APPROVED, HIPAA COMPLIANT, CYBER-SECURE, INTEGRATED TELEHEALTH SOLUTION

CLINICIAN PORTAL

Designed as an end-to-end telehealth solution, clinicians can view their schedule, analyze and manage patient records, select and connect with patients in the Virtual Exam waiting room, view biometric trending, and monitor remote patients with configurable alerts for diagnoses and assessments.

***Government Customer Note:** Recommend purchasing Care Central server stack and running on GovCloud as opposed to a commercial cloud solution.

FEATURES

- Perform effective patient encounters and timely interventions, potentially reducing ER visits and unplanned admissions.
- Expedite clinical decisions and expand reach with Care Central's Virtual Exam Room for remote patient exams and consultations.
- Eliminate transcription errors.
- Access Care Central Cloud Services using a browser with no required plug-ins.
- Monitor even your most at-risk remote patients with real-time virtual exams, store and forward diagnostic data, and patient alerts.
- Collaborate and consult with colleagues and specialists.
- Transfer patient data seamlessly to EMR systems using HL7, or web services, with Dictum Health's EMR gateway option.
- Maintain patient data security and integrity by using HIPAA-compliant services, including disaster recovery.
- Integrated ICD database
- Generate and download reports

REMOTE HEALTH
SOLUTIONS

ADMINISTRATIVE PORTAL

The Administrator Portal is used to create and manage clinical and administrative users, caregivers, and patient accounts. In addition, administrators use this portal to manage inventory and location of devices as well as to provide device software upgrades. This portal is used to set security levels, create access to portals and to define user and patient access groupings as well as to provide a conduit for EMR data exchange. The real time dash board will give a quick view of the overall system activities, inventory status, and active VERs.

VIRTUAL EXAM ROOM (VER)

From our virtual Exam waiting room in the Clinician Portal, clinicians can enter a Virtual Exam Room (VER) with a remote patient to conduct a complete examination with simultaneous video conferencing and viewing of vital signs, cardiopulmonary data, medical images and emergency services allowing clinicians to assess, diagnose, and recommend treatment with the same privacy and quality as an in-hospital exam, for even the most at-risk patients.

CRITICAL CARE MODULE

Care Central's critical care modules can help facilitate immediate access to remote specialists in critical situations, including telestroke, where time to treatment is critical for effective care. Care Central's stroke assessment module and remote access to patient radiological images can reduce door-to-needle time by improving access to remote neurologists and clinical workflow.

ALERTS

Our Care Central alert system can keep clinicians informed on the health status of patients in real-time for timely care intervention. The alert system will notify the care team via an email or text if test data values cross preset boundaries or if the patient is out of testing compliance. The system also notifies the patient if they are delinquent on taking a test or medication. Alert configuration is flexible allowing clinicians to configure compliance and test threshold alerts by patient.

ANALYTICS

Using historical data and active trend charts by patient, clinicians can make expedited clinical decisions for individual patients or analyze a certain patient population.

SEAMLESS EMR/EHR INTEGRATION

Expedite clinical workflow and improve patient safety by eliminating manual entry of patient records and transcription errors with EMR integration. Dictum Health's secure EMR gateway seamlessly syncs all patient data between the health care provider's EMR and the deployed Dictum Health platform. Dictum Health supports leading EMR/EHR providers as well as custom implementations using HL7 APIs and web services.
